

PROJECT REPORT

ROLL NO.: 23f3000789 **NAME:** MIWA HEMAL DHAROD **EMAIL:** 23f3000789@ds.study.iitm.ac.in

Project Statement: Household Services Application

It is a multi-user app (requires one admin and other service professionals/ customers) which acts as platform for providing comprehensive home servicing and solutions.

Approach:

I have provided three different logins for admin, customer and service professional respectively. Each login is redirected to their respective dashboards. The dashboards have further links to the search, summary and profile (in case of customer and service professional only) page where appropriate data and graphs are shown.

The admin can:

1. add, update and delete a service
2. view service details
3. approve or reject service professionals
4. view professional details
5. view service requests
6. search for customers, service professionals, service requests based on particular criteria
7. view overall request and ratings summary as graphs

The customer can:

1. register
2. view respective service request history
3. search for services
4. book multiple services
5. close and rate the accepted services
6. view customer request history summary as a graph
7. view profile

The service professional can:

1. register
2. view, approve or reject new customer requests
3. view respective (closed or accepted) requests
4. search for respective customer whose request they have accepted
5. view respective ratings and request summary as graphs
6. view profile

Frameworks:

Language: Python, HTML

Library: Flask, Flask-SQLAlchemy, Pandas, Matplotlib, jinja2

Database: SQLite3

ER Diagram:

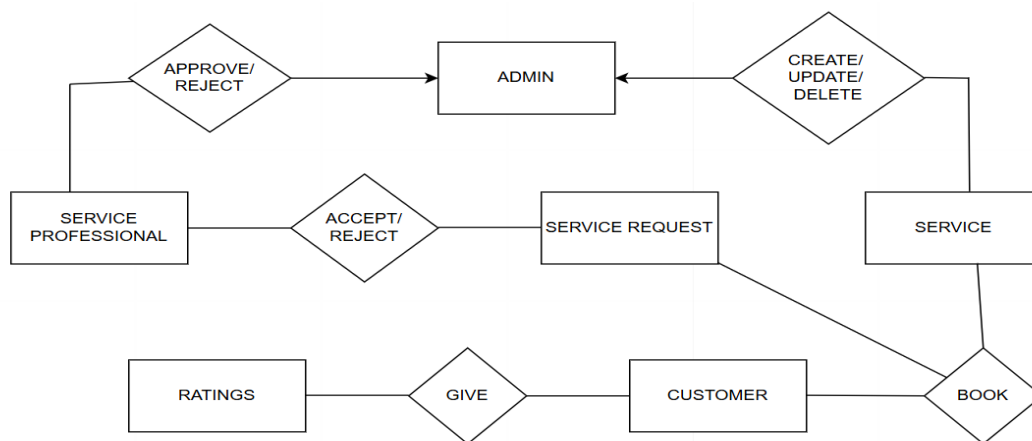

Table Schema:

admin (name, id)

service (service_id, service_name, description, time_required, base_price)

service_professional (professional_id, professional_name, service_name, experience, professional_phone, approval)

customer (customer_id, customer_name, customer_phone, location)

service_request (request_id, customer_id (fk), service_id (fk), professional_id (fk), status, visibility)

ratings (rating_id, request_id (fk), rating)

fk: foreign key

Relations:

Admin to Service: One-to-Many

Customer to Service: Many-to-Many

Customer to Service Request: One-to-Many

Service to Service Request: One-to-Many

Service Professional to Service: Many-to-One

Service Professional to Service Request: One-to-Many

Service Request to Ratings: One-to-One
